a the zero-input release and the escape criterion
input removed
scaled record
state at t_r
$\{u, \dot{u}, z\}$
restart,
zero input
damaged
hinges
free
continuation
recoverable
θ_c
committed to collapse
escapes iff
KE ≥ c W_{rem}
$U(q)$
W_{rem}
configuration q
b drift history and released states
t_{95}
t^*
t_c
t_a
running peak drift
inst. peak drift
recoverable release
committed release
peak storey drift
time (s)
c drift profile at the boundary
θ_c
storey
t_a=66.55 s
t^*=66.56 s
storey drift magnitude
d energy race along the coda
energy (kip-in)
KE(t)
$c_{dev} W_{rem}$
time (s)
e damaged-state push at t_a
release drift
W_{rem}=102 kip-in
λ (kip)
peak storey drift
